

CENTER SUPPORT BEARINGS

Our Product

Marmon Ride Control center support bearings and bearing cushions are built from high-quality materials to provide proper driveshaft support and alignment. Center support bearings are used when a vehicle's driveline requires the use of multiple driveshaft sections, increasing the driveshaft's flexibility while relieving stress on other driveline components. All Marmon Ride Control products are designed to meet or exceed OE fit, form, and function, and are engineered and manufactured to our exacting specifications to ensure ease of installation and long service life. Marmon Ride Control offers a broad range of coverage through all markets, which include agricultural, automotive, and commercial vehicle applications.

Premium rubber compounds are used to ensure a long lifespan in comparison to OE center support bearings. Competitor bearing cushions often use inferior rubber which can degrade and cause excess vibration, as well as cracks in the structure, leading to short lifespan.

Zinc-coated heavy gauge steel for superior corrosion resistance per OE specifications on many applications.

Premium sealed bearings for smooth operation and long lifespan, zinc-coated bearing dust shields included where applicable.
